

New technical centre opened

For supporting you in your automation projects right from the start, and to make the implementation transparent for you, Füll Lab Automation GmbH in Ostfildern has set up and commissioned its new technical center.

Standard modules for liquid and powder dosing, for mixing and measuring a wide variety of substances, as well as application and curing and drying of formulations are available for test purposes. We would also be pleased to carry out feasibility studies with you for the development of new functions.

With our coating equipment we carry out tests with different application methods and evaluate them.

We would be pleased to convince you of the capabilities in our technical center.

Füll Lab Automation GmbH (formerly “Bosch Lab Systems”) develops and offers innovative automation solutions for high-throughput R&D and quality control. In addition to standard machines and modules, we also develop customised systems.

Our automation solutions are suitable for a wide range of applications and industries, including paints & coatings, cosmetics, specialty chemicals, adhesives and sealants, and crop protection.

The patented “BLS syringe” is the basis for highly flexible system solutions.

Since the beginning of the year, Füll Lab Automation GmbH is part of the FÜLL Process Group, which comprises three other companies, Füll Systembau GmbH, Tecos Bruhin AG and Füll Engineering BV, and whose headquarters are located in Altnau, Switzerland.

Through the expansion of the portfolio in the entire Füll Group, we are able to offer you individual solutions in the complementary processes, to support you in automation processes and to implement these with you in a future-oriented manner.
